

Project S.U.S.P.E.N.D.S : Solution for Unsure Scholars' Problems about Evaluating the Need for the Declaration of Suspension

II. Problem Statement

At least once a week, scholars wake up to a gloomy dark sky. The first thing that comes to others mind is, "Sana suspended." Then, it rains. Scholars think, "Wala, suspended na talaga." But lunch arrives - still no suspension. Classes are dismissed - still nothing. But on a clear, sunny Tuesday, the LGU suddenly announces a suspension for the entirety of the week. Scholars wonder, how does a day with clearly no reason for a suspension be suspended, but a strong shower doesn't. In desperation for a suspension, others message the LGU or spread rumors. This causes confusion among the scholars needing the intervention of the higher ups for confirmation. The student body hence requires a solution to provide live updates of suspensions, predictions whether or not it will be suspended based on trends on previous suspensions, and a summary of the two all in one application. This is where Project S.U.S.P.E.N.D.S comes in hand - an all-in-one application to assist the scholars when it comes to up to date information on suspensions.

III. Project Objectives

1. Provide scholars with the most recent valid updates on suspensions.
2. Make predictions whether the LGU will suspend based on given information.
3. Involve all of these in a single application available to all.

IV. Planned Features

The program will ask the user for information that it can use to predict the probability of a suspension.

V. Planned Input/s & Output/s

Input/s:

Is there currently an advisory of a suspension? (Boolean)

Has a hazard recently happened or is currently happening
(Extreme Rainfall)? (Boolean)

Is there an approaching hazard near your area (Typhoon)?
(Boolean)

Output/s:

(If there is an advisory)

It will certainly be suspended based on a recent advisory.

(If one of the two remaining questions are true)

There is a medium to high chance of a suspension.

(If both of the two remaining questions are true)

It is almost certain that it classes will be suspended.

VI. Logic Plan (Pseudocode)

INPUT suspensionAnnouncement (Boolean)

INPUT incomingHazard (Boolean)

INPUT hazardInProgress (Boolean)

IF suspensionAnnouncement == True:

 PRINT "Class suspensions have been announced in an
advisory and are now taking place."

ELIF incomingHazard == True OR hazardInProgress == True:

 PRINT "There is a possible chance of a class suspension."

ELIF incomingHazard == True AND hazardInProgress == True:

 PRINT "It is almost certain that it will be suspended."

ELSE:

 PRINT "It is unlikely to be suspended."
